PROOF OF CONCEPT · OCTOBER 2026

TENFOLD

48,000 log lines in. 5 incidents out.

An AI-assisted triage desk for security analysts · Travis Anderson

THE PROBLEM

One day of logs is a firehose.

48,002 log lines. One company. One day.

288 of them are an attack.

WHAT TENFOLD DOES

It turns the firehose into a short list.

48,002 log lines → **41** odd behaviors → **5** incidents to review

All 4 attacks, plus 1 backup job that looks like one.

HOW IT WORKS

Six steps. Each one is simple.

01
Read
Every log line becomes a row.

02
Detect
Seven plain rules add points.

03
Group
Related hits become one story.

04 · AI
Judge
Malicious, benign or unsure.

05 · AI
Narrate
A short report, with sources.

06 · Human
Decide
The analyst has the last word.

THE DESIGN CHOICE THAT MATTERS

The AI explains.
It never decides.

AI ON A LEASH

Three rules keep the AI honest.

The score is math.

No model can raise it or lower it.

Nothing serious is hidden.

The AI can only set aside low scores.

Every sentence cites its evidence.

No citation, no sentence.

HUMAN IN CHARGE

The analyst has the last word.

One click to decide

Confirm | Dismiss | Escalate

Every decision is saved with its evidence.

Teach it once

"That backup is ours."

One narrow rule. It expires, so it cannot hide an attack forever.

SEE IT RUN

Live demo

tenfold-ui.vercel.app

DOES IT WORK?

Tested on 50 days it had never seen.

161/200
attacks caught

0
false alarms on ordinary traffic

34/34
AI rulings matched the answer key

Synthetic data, written by me. Every number can be rerun with one command.

WHERE IT FALLS SHORT

I found its blind spot, and measured it.

11/50

beacons caught

Why: one rule expects a steady beat.

Real malware varies its timing on purpose.

The fix is designed. It is not built.

HOW IT IS BUILT

Small, real and deployed.

The screen

Next.js

on Vercel

The engine

Go

on Railway

The data

Supabase

database, sign-in, files

The glue

One contract

keeps both sides in step

Each user sees only their own data. Tests run on every change.

WHAT COMES NEXT

Three things I would build next.

01	**Memory across days**	Catch the slow, patient attacker.
02	**Learning from verdicts**	Every analyst decision makes it sharper.
03	**A queue for scale**	Many customers, many files at once.

Small on purpose. Honest about its limits. Built to grow.
